1. **Hearing wellness data analysis**

1.1 Conclusions:

- 387 survey respondents; 74% are aged 18–24.
- 25% never experienced hearing-related FOMO.
- Older respondents use headphones less frequently.
- Nearly 80% have never taken a hearing test.
- Main hearing test barriers: lack of awareness (62%), fear (14%).
- One-third felt excluded due to hearing only in noisy settings; 27% say they were never left out.
- Nearly half missed important sounds in certain situations.
- Older respondents show stronger belief in early hearing care.
- Most view hearing as staying connected, enjoying music, laughter, and life (60%).

1.2 Recommendations:

- Conducting educational initiatives and advertising campaigns to enhance public awareness regarding hearing testing and the importance of early intervention in hearing care.
- Raise awareness about the issue of not getting hearing tests and highlight the numbers.
- It is essential to eliminate psychological barriers such as anxiety or a sense of exclusion and to emphasize the practical benefits of good hearing—for example, supporting social relationships, enabling full enjoyment of music, or facilitating effective participation in social life.
- Developing a concept for a hearing application

2 **Hearing app**

2.1 Conclusions:

- 80% of respondents are interested in a hearing app; 46% if it's easy to use, 35% say it would be helpful.
- Strong interest is highest among those with fear or cost concerns about traditional hearing tests (45%).
- Interest declines with age; older users prefer hospital testing over app-based alternatives.
- 50% are open to paid app tests if value is clear.
- 75% are willing to invest in a hearing app.
- Top desired features: quick tests (16%), doctor consultation (12%).
- Most respondents want no or only occasional ear discomfort from app use.

2.2 Recommendations:

- It is worth considering the creation of an intuitive, accessible self-hearing test application, emphasizing its ease of use and real value. Communication should be tailored to different age groups: for older individuals, it may still be important to promote traditional hearing tests at medical facilities, while for younger groups, the convenience and safety of a digital solution should be highlighted.
- The app includes features such as quick tests, options for doctor consultation, and report generation.
- Finally, when designing the user experience, it is important to minimize the risk of discomfort during tests, ensuring that even sensitive individuals can use the app freely. Implementing these recommendations should increase trust and accessibility for a wide range of users.
